ABSTRACT

The skin can host metastatic tumors originating from different organs. We report a case of metastatic renal cell carcinoma to the scalp in a 73-year-old man with features very similar to those of thyroid papillary carcinoma. The histogenesis in relation to its structure is discussed.

Key words: papillary carcinoma, thyroid-like tumor, renal cell carcinoma, metastasis.

This work received no specific grant from any funding agency in the public, commercial, or not-for-profit sectors.
